

# TuberTonic® for Potatoes

TuberTonic® is a biological seed treatment and natural biostimulant. It contains a beneficial soil microorganism that unlocks bound nutrients such as phosphorus, potassium, calcium and zinc.

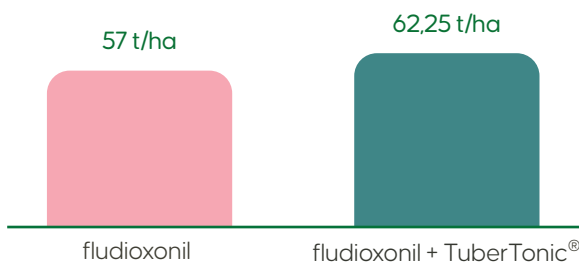

TuberTonic® stimulates the plant to make better use of the soil's nutrient content from the very start of growth. This enhances the crop's overall yield potential. The microorganism originates from Nordic soils and is well adapted to cold sowing conditions.

Two years of trials have demonstrated increased potato yield and higher starch content per hectare.

TuberTonic® is supplied as a powder and mixed with water prior to application to seed tubers. The product can be used both via roller-table treatment or applied directly in-furrow on the planter.

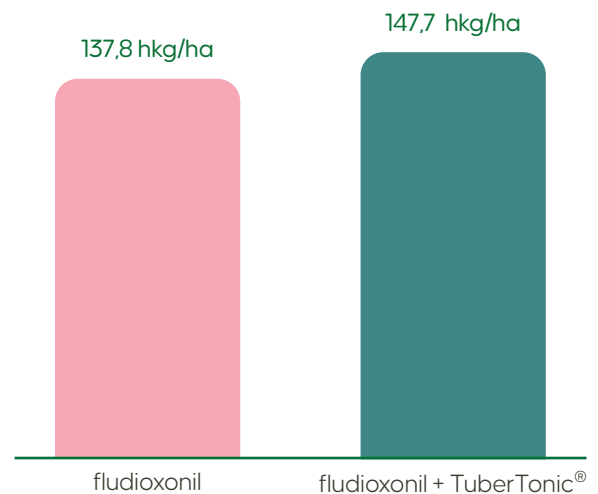

## TuberTonic® can increase potato yield and the amount of starch per hectare

Yield

**Up to 9,2 % increased yield**

Hkg starch/ha

**Up to 7,2 % more starch**

Data from external field trials (AKV Langholt, 2025)

**Chris Turner**
